

# Cedara OrthoWorks Care Manager™

2004-03705 V.2.0

## The Most Dynamic Orthopaedic Clinical Data Management System

Cedara OrthoWorks Care Manager™ is a powerful clinical data management system that organizes clinical information, allowing for data analysis and manipulation. For example, the product can be used in the following situations:

- Systematic patient clinical follow-up
- Insurance claim evaluations
- Multi-centric clinical studies
- Implant tracking

Developed with surgeons for surgeons, Care Manager's unique event-based workflow and flexible infrastructure fits the way surgeons organize their daily work, making it the most efficient and surgeon-friendly application available.

### Control Your Clinical Data

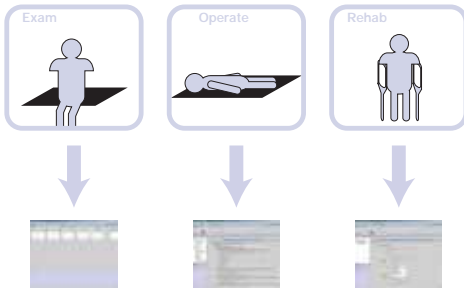

Cedara OrthoWorks Care Manager supports complex information management using an easy-to-use wizard. You can customize search parameters and extract valuable information.

### Track Your Clinical Data Over Time

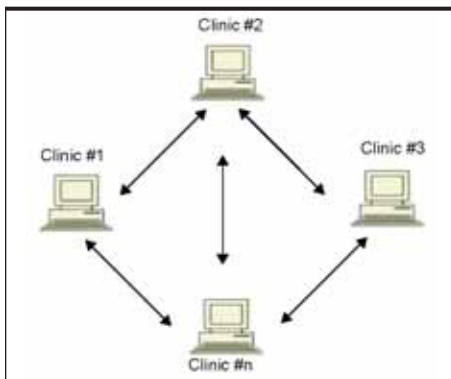

With Cedara OrthoWorks Care Manager, surgeons can easily capture and track vital information about their patients, diagnosis, treatment, and outcomes over time. The unique patient timeline visually captures patient history, providing quick access to patient information.

# Cedara OrthoWorks Care Manager™

Managing data from all stages of orthopaedic workflow, Cedara OrthoWorks Care Manager provides a comprehensive solution for information capture from clinical settings

Cedara OrthoWorks Care Manager allows orthopaedic specialists to analyze results and track patient outcomes through structured forms and data mining

## Speed Workflow with Automatic Population of Data Fields

Workflow is improved with automatic population of data fields for clinical data management. For instance, Cedara OrthoWorks Care Manager is fully integrated with OrthoWorks Spine Analyzer™ which helps spine surgeons and radiologists analyze cervical, thoracic, and lumbar spine mobility, alignment, and deformities.

## Share Information Securely Anywhere in the World

Cedara OrthoWorks Care Manager allows each client to be attached to a host site that stores all data, managing user access and individual user profiles. The system securely exchanges selected information with other users on a patient-by-patient basis, protecting patient identity where appropriate.

Participating sites can:

- Perform clinical analysis mobility using flexion and extension x-rays
- Safely share data via e-mail with users around the world
- Securely communicate with other sites
- Control data anonymously

## Powerful Data Mining

- Easy to use visual interface for queries
- Uses same data fields as patient entry
- Export data to MySQL database for further statistical analysis

## Technical Environment

- Java-based application
- Runs on a standard PC
- Runs on a standard relational database platform
- Uses standard interfaces for import and export
